investigate-movies-dataset (1) (1)

July 6, 2023

Tip: Welcome to the Investigate a Dataset project! You will find tips in quoted sections like this to help organize your approach to your investigation. Before submitting your project, it will be a good idea to go back through your report and remove these sections to make the presentation of your work as tidy as possible. First things first, you might want to double-click this Markdown cell and change the title so that it reflects your dataset and investigation.

1 Project: Investigate a Dataset (Replace this with something more specific!)

1.1 Table of Contents

Introduction

Data Wrangling
Exploratory Data Analysis
Conclusions
Introduction

Tip: In this section of the report, provide a brief introduction to the dataset you've selected for analysis. At the end of this section, describe the questions that you plan on exploring over the course of the report. Try to build your report around the analysis of at least one dependent variable and three independent variables.

If you haven't yet selected and downloaded your data, make sure you do that first before coming back here. If you're not sure what questions to ask right now, then make sure you familiarize yourself with the variables and the dataset context for ideas of what to explore.

Brief introduction to the dataset I've selected for analysis:

The TMDb movie data set contains information about 10,000 movies collected from The Movie Database (TMDb), including user ratings and revenue. * Certain columns, like 'cast' and 'genres', contain multiple values separated by pipe (|) characters. * There are some odd characters in the 'cast' column. Don't worry about cleaning them. You can leave them as is. * The final two columns ending with "_adj" show the budget and revenue of the associated movie in terms of 2010 dollars, accounting for inflation over time.

Questions: * 1. How is the Walt Disney's profit year by year? * 2. What is the people demand for watching movies year by year?

Data Wrangling

Tip: In this section of the report, you will load in the data, check for cleanliness, and then trim and clean your dataset for analysis. Make sure that you document your steps carefully and justify your cleaning decisions.

1.1.1 General Properties

```
In [11]: # Load your data and print out a few lines. Perform operations to inspect data
         # types and look for instances of missing or possibly errant data.
         df = pd.read_csv('Database_TMDb_movie_data/tmdb-movies.csv')
         df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10866 entries, 0 to 10865
Data columns (total 21 columns):
id
                        10866 non-null int64
imdb_id
                        10856 non-null object
                       10866 non-null float64
popularity
                        10866 non-null int64
budget
                        10866 non-null int64
revenue

```
dtypes: float64(4), int64(6), object(11)
memory usage: 1.7+ MB
```

Tip: You should *not* perform too many operations in each cell. Create cells freely to explore your data. One option that you can take with this project is to do a lot of explorations in an initial notebook. These don't have to be organized, but make sure you use enough comments to understand the purpose of each code cell. Then, after you're done with your analysis, create a duplicate notebook where you will trim the excess and organize your steps so that you have a flowing, cohesive report.

Tip: Make sure that you keep your reader informed on the steps that you are taking in your investigation. Follow every code cell, or every set of related code cells, with a markdown cell to describe to the reader what was found in the preceding cell(s). Try to make it so that the reader can then understand what they will be seeing in the following cell(s).

1.1.2 Data Cleaning (Replace this with more specific notes!)

In this section, we will get used columns from dataset, remove duplicate rows and rows with invalid values.

```
In [20]: # After discussing the structure of the data and any problems that need to be 
# cleaned, perform those cleaning steps in the second part of this section.
```

1. Get used columns for this investigation

```
In [12]: df.drop(['id','imdb_id','budget','revenue','genres','original_title','cast','homepage',
         df.to_csv('tmdb-movies-edited.csv', index=False)
         df_movies = pd.read_csv('tmdb-movies-edited.csv')
         df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10866 entries, 0 to 10865
Data columns (total 6 columns):
popularity
                         10866 non-null float64
production_companies 9836 non-null object release_date 10866 non-null object
                       10866 non-null int64
release_year
                        10866 non-null float64
budget_adj
revenue_adj
                         10866 non-null float64
dtypes: float64(3), int64(1), object(2)
memory usage: 509.4+ KB
```

2. Remove duplicate records

```
<class 'pandas.core.frame.DataFrame'>
Int64Index: 10865 entries, 0 to 10865
Data columns (total 6 columns):
popularity
                        10865 non-null float64
                        9835 non-null object
production_companies
release_date
                        10865 non-null object
release_year
                        10865 non-null int64
budget_adj
                        10865 non-null float64
                        10865 non-null float64
revenue_adj
dtypes: float64(3), int64(1), object(2)
memory usage: 594.2+ KB
  3. Remove rows with empty production_companies
In [14]: df_movies.dropna(subset=['production_companies'], inplace=True)
         df_movies.to_csv('tmdb-movies-edited.csv', index=False)
         df_movies = pd.read_csv('tmdb-movies-edited.csv')
         df_movies.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 9835 entries, 0 to 9834
Data columns (total 6 columns):
popularity
                        9835 non-null float64
                        9835 non-null object
production_companies
release_date
                        9835 non-null object
                        9835 non-null int64
release_year
budget_adj
                        9835 non-null float64
revenue_adj
                        9835 non-null float64
dtypes: float64(3), int64(1), object(2)
memory usage: 461.1+ KB
  4. Remove rows with '0' values
In [15]: df_clean_invalid_values = df_movies.replace(0,np.NaN)
         df_movies = df_clean_invalid_values.dropna()
         df_movies.to_csv('tmdb-movies-edited.csv', index=False)
         df_movies = pd.read_csv('tmdb-movies-edited.csv')
         df movies.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 3808 entries, 0 to 3807
Data columns (total 6 columns):
popularity
                        3808 non-null float64
production_companies
                        3808 non-null object
release_date
                        3808 non-null object
release_year
                        3808 non-null int64
                        3808 non-null float64
budget_adj
```

```
3808 non-null float64
revenue_adj
dtypes: float64(3), int64(1), object(2)
memory usage: 178.6+ KB
  5. Change some columns type to integer or string
In [20]: df_movies[['popularity','release_year','budget_adj', 'revenue_adj']] = df_movies[['popu
         df_movies['production_companies'] = df_movies['production_companies'].astype(str)
         df_movies.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 3808 entries, 0 to 3807
Data columns (total 6 columns):
popularity
                        3808 non-null int64
production_companies
                        3808 non-null object
release_date
                        3808 non-null object
                        3808 non-null int64
release_year
                        3808 non-null int64
budget_adj
revenue_adj
                        3808 non-null int64
dtypes: int64(4), object(2)
memory usage: 178.6+ KB
  6. Add profit column -> Caculating this column by (revenue_adj - budget_adj)
In [21]: df_movies.insert(6,'profit',df_movies['revenue_adj']-df_movies['budget_adj'])
         df_movies.to_csv('tmdb-movies-edited.csv', index=False)
         df_movies = pd.read_csv('tmdb-movies-edited.csv')
         df_movies.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 3808 entries, 0 to 3807
Data columns (total 7 columns):
popularity
                        3808 non-null int64
production_companies
                        3808 non-null object
release_date
                        3808 non-null object
                        3808 non-null int64

profit
dtypes: int64(5), object(2)
memory usage: 6.5+ KB
```

Exploratory Data Analysis

Tip: Now that you've trimmed and cleaned your data, you're ready to move on to exploration. Compute statistics and create visualizations with the goal of addressing the research questions that you posed in the Introduction section. It is recommended that you be systematic with your approach. Look at one variable at a time, and then follow it up by looking at relationships between variables.

1.1.3 Research Question 1 (How is the Walt Disney's profit year by year?)

```
In [23]: # Use this, and more code cells, to explore your data. Don't forget to add
             Markdown cells to document your observations and findings.
         def disney_trend(column_profit,column_year):
             df_movies = pd.read_csv('tmdb-Disney-movies.csv')
             #graph size
             plt.figure(figsize=(6,4), dpi = 120)
             plt.plot(df_movies.groupby(column_profit)[column_year].sum())
             max_year = df_movies.groupby(column_profit)[column_year].sum().idxmax()
             max_value = df_movies.groupby(column_profit)[column_year].sum().max()
             min_year = df_movies.groupby(column_profit)[column_year].sum().idxmin()
             min_value = df_movies.groupby(column_profit)[column_year].sum().min()
             return max_year, max_value, min_year, min_value, plt
In [24]: max_year,max_value,min_year,min_value,plt = disney_trend('release_year','profit')
         plt.xlabel('Release Year', fontsize = 9)
         plt.ylabel('Profit', fontsize = 9)
         plt.title('The Walt Disney profit year by year')
         plt.show()
         print('Year has max profit: ',max_year,' with value: ', max_value)
         print('Year has min profit: ',min_year,' with value: ', min_value)
```

Year has max profit: 2010 with value: 2526186476 Year has min profit: 1985 with value: -35624417

Observation: >> From the above chart, it can be seen that the profit of Disney goes down from 1970 to 1985. Then, it goes up again.

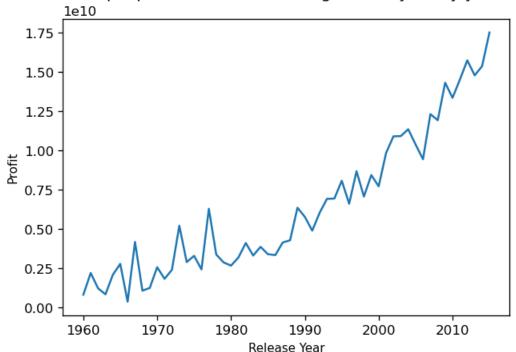

1.1.4 Research Question 2 (What is the people demand for watching movies year by year?)

Investigate: > This question can be investigated through 2 variables (the movies' profit and popularity): > * For the movies' profit, we need to see the profit trend over the years > * For the movies' popularity, we need to see the popularity year by year

1. The profit trend over the years

```
return max_year,max_value,min_year,min_value,plt
```

The people demand of watching movies year by year

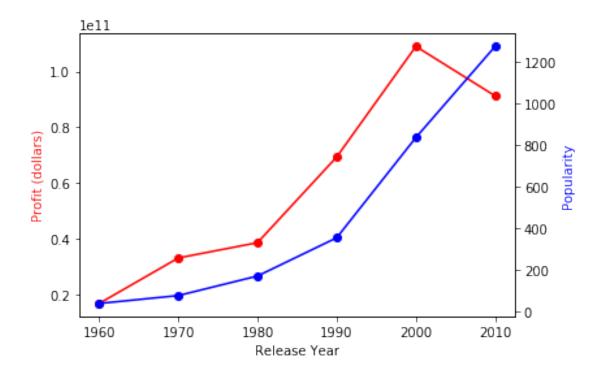

Year has max profit: 2015 with value: 17509565964

Year has min profit: 1966 with value: 352485422

2. The movies' popularity year by year

```
bins = [1960,1970,1980,1990,2000,2010]
                                    group_names=['1960-1970','1970-1980','1980-1990','1990-2000','2000-2010','2010-2015
                                    ind = np.digitize(df_movies[column_year], bins)
                                    df_profit = df_movies.groupby(ind)[column_profit].sum().to_frame()
                                          df_profit.head()
                                         print(df_profit)
                                    df_popularity = df_movies.groupby(ind)[column_popularity].sum().to_frame()
                                    X_{axis} = np.arange(1960, 2015, 10)
                                    fig,ax=plt.subplots()
                                    ax.plot(X_axis, df_profit[column_profit], color="red", marker="o")
                                    ax.set_xlabel('Release Year')
                                    ax.set_ylabel('Profit (dollars)', color="red")
                                    ax2=ax.twinx()
                                    ax2.plot(X_axis, df_popularity[column_popularity], color="blue",marker="o")
                                    ax2.set_ylabel("Popularity", color="blue")
                                         plt.bar(X_axis-0.2, df_profit[column_profit].to_list(), 0.4, label = 'Profit')
                                         plt.bar(X_axis+0.2, df_popularity[column_popularity].to_list(), 0.4, label = 'Popularity' | Popularity | P
                         #
                                         plt.xticks(bins, group_names)
                                         plt.xlabel("Release Year")
                                         plt.ylabel("Amount of money (Dollars)")
                                         plt.title("The people demand for watching movies year by year")
                                         plt.legend()
                                    plt.show()
In [33]: popularity_trend('profit', 'popularity', 'release_year')
```

Observation: > From both charts above, it can be seen that the movies' profit and popularity are increasing from 1960 to 2015. Therefore, the people demand of watching movies also increase year by year.

Conclusions

Tip: Finally, summarize your findings and the results that have been performed. Make sure that you are clear with regards to the limitations of your exploration. If you haven't done any statistical tests, do not imply any statistical conclusions. And make sure you avoid implying causation from correlation!

Tip: Once you are satisfied with your work, you should save a copy of the report in HTML or PDF form via the **File** > **Download** as submenu. Before exporting your report, check over it to make sure that the flow of the report is complete. You should probably remove all of the "Tip" quotes like this one so that the presentation is as tidy as possible. Congratulations!

In this investigation, we can find that there is more demand for watching movies year by year. Besides, we know the Disney's profit as well as the max and min profit it had from 1960 to 2015.

However, there are still limits. The above observations may be not accurate because of the lacking of data from removing some invalid datas.
